

PLOUGH RANGE

The new generation of MASCHIO GASPARDO ploughs combines operational reliability with a high quality of work in a completely renewed design. MASCHIO GASPARDO offers a complete range of mounted and semi-mounted reversible ploughs, both in- and out-of-furrow. These characteristics, together with the high resistance steels used and the wide selection of mouldboards and skimmer mouldboards, provide the right solution for every working condition.

AGRONOMIC ADVANTAGES

- *Optimal breakup of clumps and better aeration of the ground*
- *Decompaction of the soil and consequent improved root development*
- *Increased storage capacity*
- *Turns under soil improvers, residual crops and weeds*
- *Turns the vegetative reproductive organs of perennial weeds onto the surface (bulbs and rhizomes), exposing them to the devitalising action of atmospheric agents*
- *Deeply buries both the wintering stages of harmful insects and the seeds of annual and biennial species, limiting their germination power*

MOULDBOARDS, SKIMMER MOULDBOARDS (UNICO and MIRCO)

MP1XS - Full mouldboard, semi-helical, ideal for medium/loamy soils.
(Working depth 10-25 cm).

MP4WP - Full mouldboard, semi-helical, ideal for very sticky soils.
(Working depth 20-30 cm).

MP4WD - Full-mouldboard, semi-helical, ideal for heavy/wet soils for tractors with wide wheels (≤ 800 mm). (Working depth 15-30 cm).

MP4WS - Full mouldboard, helical, ideal for medium/humid soils.
(Working depth 15-30 cm).

MP4WN - Full mouldboard, semi-helical, ideal for heavy/humid soils.
(Working depth 20-30 cm).

MP4N - Mouldboard with slats, semi-helical version, ideal for heavy/humid soils.
(Working depth 20-30 cm).

MP6WC - Full mouldboard, cylindrical, ideal for very clayey soils.
(Working depth 30-45 cm).

MP6WS - Full mouldboard, semi-helical, ideal for very clayey soils.
(Working depth 30-45 cm).

MP4C - Mouldboard with slats, cylindrical, ideal for sandy/loamy soils.
(Working depth 25-40 cm).

MP4WC - Full mouldboard, cylindrical, ideal for sandy/loamy soils.
(Working depth 25-40 cm).

MP6C - Mouldboard with slats, cylindrical, ideal for very clayey soils.
(Working depth 30-45 cm).

INTELLIGENT SKIMMER MOULDBOARDS

Quick and easy adjustment of the skimmer mouldboard

Using the pin adjustment system it is possible to change the working height of the skimmer mouldboards easily and quickly. To adjust their working depth, just remove the plug and move the flap to the top or bottom depending on the crops remaining in the field.

Maize skimmer mouldboard

Excellent with high amounts of straw and maize stalks.

Universal skimmer mouldboard

Suitable for use in intermediate residual conditions.

Deflector

The deflector can be used together or in place of the skimmer mouldboards. It should be used when there are high quantities of residues, facilitating their burial.

FRAME ADJUSTMENTS

Vertical adjustment

The plough beams must be set perpendicular to the ground during ploughing. To adjust correctly, simply use the adjustment screws on the lower part of the head.

Adjust the main frame of the plough so that it is parallel to the ground by adjusting the third point.

SAFETY SYSTEM (UNICO and MIRCO)

1 *Shear bolt mechanical safety*

The classic bolt solution is simple and reliable, recommended for those terrains where the presence of stones and obstacles is occasional.

Simple and quick

All bodies are equipped with a shear bolt. After exceeding the breaking limit, the bolt is severed by lifting the body and preventing damage to the machine. Replacing the bolt is very simple and fast, even in the field.

**MAXIMUM
PERFORMANCE!**

2 *Active safety system: NSH*

With the NSH system, hydraulic jacks with hydraulically adjustable preloads from the cab allow the lifting of the working bodies in the event of a collision, returning to position as soon as the obstacle is overcome.

1st and 4th body with increased cylinder bore.

In particularly onerous working positions, the first and the fourth body are equipped with jacks with increased bore to support a higher load.

Double safety: NSH + shear bolt

This system is suitable for soils with large stones that with the bolt system would frequently break and possibly damage the structure. Each body can rise completely until the obstacle is completely surpassed and then return to the working position without having to stop the tractor.

If the pressure applied to the mouldboard should be too high for the NSH system, the shear bolt will be sliced, avoiding possible breakage.

**HORIZONTAL
SHIFT**

Full protection

The new toggle device is designed to absorb both vertical and horizontal impacts. Thanks to this solution, both the frame structure and the body itself are protected against stress.

**VERTICAL
SHIFT**

It bends but does not break

Each machine is equipped with a nitrogen accumulator with pistons that allows the management of hydraulic oil overpressures in the event of obstacles, responding quickly to bring the body back into working position once it has passed.

The pressures vary, but without losses

Depending on the terrain and how it is used, the hydraulic system pressure can be easily adjusted from the tractor cab. To reduce it, all the oil will return inside the tractor hydraulic system without spills.

NO OIL LOSS!

Pressure gauge for body preload adjustment

For a correct setting of the safety system, a pressure gauge is supplied that allows rapid management of the hydraulic circuit pressure.

UNICO

For professional ploughing:

Parallelogram frame: SMOOTH SET

The SMOOTH SET parallelogram frame has an innovative adjustment system that:

- Corrects the ploughing for better use of the tractor
- Adjusts the first body even when the machine is moving (without changing the working width of the other bodies)
- Adjusts the working width

This characteristic of the frame allows very quick settings. Moreover, all the functions are intuitive and simple to adjust, so it is easy to adapt the plough to the terrain, the amount of residue and the working depth.

SET THE WORKING WIDTH

Mechanical adjustment (PASSO)

The working width mechanical adjustment system is simple and robust. Thanks to the five settings it is possible to find the best configuration in just a few steps.

Continuous hydraulic adjustment with automatic memory (VARIO)

The hydraulic working width adjustment system is both quick and versatile and allows adjusting the width even during work. The variable adjustment, from 30 to 55 cm for each body according to the type of mouldboard used, allows perfect adaptation to any condition and is particularly useful for finishing field edges. The working width is changed with a hydraulic jack acting on the specific controls of the hydraulic power unit.

From the second half of 2019 the new jacks will have valves incorporated in the cylinder body.

Minimum working width: 30 cm

Maximum working width: 55 cm

Simple and fast adjustments

SETTING THE WORKING WIDTH OF THE FIRST BODY

Different treads and different working widths require a correct setting of the first body to ensure adequate furrow closure behind the tractor. The regulation system (L1) allows finding the correct setting in a simple and intuitive way. If the front furrow is too tight, simply extend the external jack (mechanical or hydraulic with automatic memory) or vice versa.

GOUGE ADJUSTMENT

By adjusting the mechanical or hydraulic jack (L2), the plough's gouge can be corrected with respect to the tractor's direction of travel.

This adjustment eliminates the lateral thrust, optimising the layout of the traction points and reducing the stress on the plough and tractor. This way it is possible to increase the level of comfort, at the same time achieving a reduction in slippage and fuel consumption.

Extendible frame

Storage compartment

Hydraulic coupling compartment

Disc coultter

IT IS POSSIBLE TO WORK WITH A LIMITED NUMBER OF HYDRAULIC DISTRIBUTORS

Attentive to every detail

With the latest update, to guarantee the best protection of the hydraulic tubes, high-strength textile sheaths were used, ensuring maximum resistance to mechanical stress.

New keypad

The new keypad allows activating or deactivating the tool's hydraulic functions. With it the galvanised filters are standard.

[VARIO]

Hydraulic adjustment of the working width.

[NSH]

Adjustment of the hydraulic pressure.

[WHEEL]

Adjustment of the working depth.

[1ST BODY]

Adjusting the working width of the first body.

[NO ALIGNMENT]

Allows disabling/excluding alignment of the bodies in the rotation phase for the end-of-field operations.

WE FOCUS ON QUALITY

Interchangeable head

The head has been designed to offer maximum stability and solidity in the connection to the tractor. The third point and the rotation pin are part of a central body incorporated in the plough, while the attachments for the lift are bolted onto removable flanged bodies.

BENEFITS

- Possibility of rapidly changing from fixed head configuration to oscillating
- Possibility of changing in a few seconds to attachments of different categories
- Moreover, two possible heights for connecting to the lifter to be able to adapt to tractors with wheels of different sizes

2nd and 3rd category interchangeable connections

High quality painting

The new powder system ensures a quality coating that guarantees maximum protection of the frame and the head over time. A special paint – called peelable – is applied to the parts that are actively in contact with the ground, keeping the plough in perfect aesthetic condition until the moment of its first use in the field.

With the ploughing the paint will be worn off (leaving only the hardened steel in contact with the ground), optimizing the flow of the soil, improving the rotational performance of the dirt clumps and decreasing resistance to traction.

Bolted machine

All supports and plates are bolted to the frame. The lack of welded points guarantees great durability, reliability and stability even under heavy stress.

A wheel for every taste

Smart wheels

MASCHIO GASPARDO ploughs can be equipped with:

- Front or rear depth wheel with mechanical adjustment with shock absorber
- Front or rear combined depth and transport wheel with mechanical or hydraulic adjustment

The **FRONT OR REAR DEPTH WHEEL WITH MECHANICAL ADJUSTMENT** allows increasing or decreasing the depth simply by acting on the adjustment screw.

The **COMBINED DEPTH AND TRANSPORT WHEEL WITH MECHANICAL ADJUSTMENT** (front or rear) allows road transport of the plough and the adjustment of the working depth during ploughing. For correct adjustment it is sufficient to act on the mechanical tie rod.

The **COMBINED DEPTH AND TRANSPORT WHEEL WITH HYDRAULIC ADJUSTMENT** (front or rear) allows adjusting the depth directly from the tractor, making it the most comfortable and convenient to use. The shock absorber minimises the stress on the chassis caused by bumpy roads. At the same time, the increased wheel support guarantees durability and strength even at the highest transport speeds, avoiding cracks along the weld. **NITROGEN ACCUMULATOR INCLUDED AS STANDARD.**

Safe on the road

In the transport position the plough is towed in the "butterfly" position. This way the wheel discharges part of the weight onto the ground, limiting the pitching even with tractors having reduced wheelbase and allowing a comfortable and safe transport.

UNICO XS

from 55 to 90 hp

UNICO XS

UNICO XS

is a mounted, reversible plough for in-the-furrow ploughing. It can mount 2 or 2+1 bodies, and this makes it suitable for coupling with medium/low-power tractors (55-90 hp).

2+1

Thanks to a joining plate it is possible to add an additional working body. With some bolts, the operation can be completed in a few moments.

Small but indestructible

Frame and support plates are specifically designed to ensure maximum strength.

Small, but tough!

It gets around with ease

The plough's robust rotation mechanism is hydraulic and ensures precise and uniform rotation on both sides.

Fixed head with a 2nd category 3-point attachment.

Adjustment of the mechanical working width (PASSO)

Thanks to 2 mechanical jacks it is possible to correctly configure the parallelogram frame. The working width of the first body is adjusted with the outermost jack, while the inner jack is used to correctly set the plough gouge, making the traction line coincide with that of the tractor, reducing lateral drift and achieving ideal operation.

***LOWER VIBRATIONS,
LESS TRACTOR DRIFT!***

Safety system with shear bolts

The shear bolt safety system protects the frame and working bodies from any hidden obstacles below the surface.

Rear wheel with a section width of 138 mm and a diameter of 480 mm.

UNICO S up to 120 hp **UNICO M “classic line”** up to 150 hp

UNICO M 3E

UNICO S and M "Classic Line" are two mounted reversible ploughs with a parallelogram frame for in-the-furrow working, suitable for medium-power tractors.

The right size for every need

Both are "lightweight" ploughs that have all the robustness and practicality of the larger models. Both can have oscillating or fixed heads.

UNICO M 3E

HIGH-RESISTANCE STEEL COMPONENTS

Usable anywhere

Thanks to the generous distance between the bodies (95-105 cm) and the high ground clearance of 80 cm, maximum versatility is guaranteed.

Simple and intuitive

UNICO S:

UNICO M 4E

Wide selection

Both models can be extended and, if necessary, offer the possibility of adding a further working body. They can also have:

- Shear bolt or NSH safety system
- Mechanical (PASSO) or hydraulic (VARIO) working width adjustment

Only rear wheels are available for all versions of UNICO S.

UNICO M up to 200 hp **UNICO L** up to 300 hp

UNICO L 4E

UNICO M and L are two mounted reversible ploughs for in-the-furrow working, suitable for medium/high-power tractors. Both have a sturdy frame, respectively measuring 120x120 mm and 140x140 mm.

PACKER roller arm (PACKER ARM)

All the UNICO models have a front plate on which a side arm can be mounted to carry a PACKER roller. The combination of plough and roller allows compacting and refining the freshly ploughed soil, limiting water losses by evaporation and allowing both sowing and optimal germination in a single pass.

Never change a winning plough

Uniform work surface

The combined work of the wheel and the head adjustments allows keeping the plough parallel to the ground for a uniform work surface.

UNICO XL IN-THE-FURROW and OUT-OF-FURROW *up to 350 hp*

UNICO XL 3E

UNICO XL is a reversible mounted plough for in-the-furrow and/or out-of-furrow working, with the number of bodies ranging from 3 to 6 and that can be used with medium/high-power tractors.

Performance guaranteed

To be able to adapt to any type of terrain, the frame and the most highly stressed parts were strengthened and the beams of the skimmer mouldboards reinforced. Moreover, for each ploughshare bolted chisels with tungsten carbide inserts have been mounted ensuring maximum resistance to wear.

With the new reinforced high landsides, UNICO XL ensures an ideal compaction of the soil near the cutting area, avoiding the descent of soil inside the ploughed furrow.

HEAVY DUTY (HD) IN-FURROW/OUT-OF-FURROW version

In its HD version, the plate for the plough beam coupling plates has been reinforced. Furthermore, the sections of the plough beam have been increased to 90x40 mm and coupled to 15 mm plough beam coupling plates.

Benefits of OUT-OF-FURROW ploughing

- *No plough sole created by the slippage of the tyres inside the furrow*
- *No wear on the inside of the tyres*
- *Limited vibrations (maximum comfort for the operator)*

Benefits of IN-FURROW ploughing

- *Burying of sludge and manure*
- *Greater precision in the absence of parallel driving*

FRAME 160X160 mm
HEAD Ø 130 m

In-furrow or Out-of-furrow...in seconds!

Parallelogram UNICO XL IN-FURROW/OUT-OF-FURROW

In just a few seconds, UNICO XL IN-FURROW/OUT-OF-FURROW lets you switch from an in-furrow plough to an out-of-furrow plough (and vice-versa) thanks to a simple hydraulic mechanism, combining the benefits of in-furrow and out-of-furrow ploughing in a single machine.

MIRCO

up to 500 hp

MIRCO 8+1

Ultimate ploughing

MIRCO, a semi-mounted reversible plough for in-furrow and/or out-of-furrow working with a number of bodies ranging from 6 to 9, is bursting with quality and technology that guarantee top performance. All adjustments can be managed directly from the cab.

FRAME 160X160 mm

HEAVY DUTY (HD) IN-FURROW/OUT-OF-FURROW version

Thanks to the toggle system that can be adjusted by means of an independent jack directly from the tractor cab, it is possible to switch from in-furrow ploughing to out-of-furrow ploughing in just a few seconds.

Perfect depth control

The working depth is controlled by a rubber wheel (two in the in-furrow/out-of-furrow version for greater support) in order to obtain a precise work surface.

New look, new improvements

The latest developments for 2018 guarantee durability

The new third point limits the stress on the tractor; there are also new anchor plates with larger screws (\varnothing 20 mm), new plough beams with increased cross-sections (80x35 mm) and spacer bushes with a diameter of 45 mm, actually expanding the contact surface inside the side plates. Thanks to plough beams with an increased cross-section (90x40 mm) and a 90 cm clearance under the frame, the HD version guarantees greater durability and better residue management.

New parking pin on the head

The new pin allows safe parking of the plough head. The same pin is used for attachment to the third point of the tractor. This way the hitching and unhitching operations are simple and safe.

Always level

In a few seconds, with the removable screw inserted, it is possible to adjust the verticality of the plough. And just as quickly, simply by extracting the screw, it is possible to guarantee parking that is perfectly level.

New articulated joint reinforced on the rear wheel.

- **EFFECTIVE AND EFFICIENT SYSTEMS**
- **MORE DURABLE**

Centralised greasing

Thanks to the new centralised greasing system it is possible to reach all the greasing points at once.

ADJUSTMENTS FOR EFFECTIVE PLOUGHING

Mechanical adjustment (PASSO)

The working width mechanical adjustment bolt system is simple and intuitive. Thanks to the five available settings you can find the most suitable configuration (33-38-44-50-55 cm).

Continuous hydraulic adjustment (VARIO)

This system allows you to change the working width even while working thanks to a hydraulic jack that can be adjusted directly from the cab.

The adjustment varies from 30 to 55 cm for each body.

Adjustment of the first body

To adjust the working width of the first body, it is sufficient to adjust the length of the mechanical tie rod or of a hydraulic cylinder (depending on the selected configuration).

Gouge adjustment

With the new gouge adjustment it is possible to carry out the appropriate macro and micro corrections, allowing the tractor to discharge all the power into the ground, limiting the stress to the tractor and plough.

Superior durability...maximum agility

New triangle system

The central adjustment rod – mechanical or hydraulic – creates a triangle structure that allows the forces to be discharged directly on the rear wheel. This makes it possible to stiffen the frame geometry, avoiding bending and improving the stability of the whole structure during ploughing.

LESS TIME AND SPACE LOST WHEN TURNING AND SHORTER HEADLANDS!

The 1st and the 2nd points have a new anti-rotation seat and a new pin.

Agility is its strength

The articulated head allows a rotation angle up to 105° (limited turning radius) allowing delayed and easy turning at the headland.

To guarantee the inversion of the plough, two hydraulic cylinders are used that allow easy rotation without backlashes.

PLOUGHING IN EVERY CONDITION

Working depth in furrow and out of furrow

The rear wheel, 500 mm wide and 945 mm high, creates a large support surface, reducing trampling and ensuring maximum performance even in wet terrain, preventing the plough from getting stuck.

In order to guarantee a uniform working depth, the out-of-furrow versions have a front wheel that is more than 300 mm wide supplied as standard, which makes it easier to follow the terrain more precisely.

Generous clearance

Thanks to the ample ground clearance of 80 cm (90 cm in the HD version) and the generous distance between the bodies (105 cm), MIRC guarantees maximum versatility of use by offering the possibility of working even with abundant crop residue.

HEAVY DUTY frame

The 160x160x10 mm frame is made of high-strength steel. This has allowed us to create a product with a low weight while guaranteeing maximum durability and excellent reliability.

Maximum grip

New for 2019

Wheels with new profiles for a better grip and an excellent outflow of soil and mud from the tread (500/50-17 and Ø945 x 500 mm).

When necessary it helps you to brake

The 550/45-22.5 wheel with Ø1070 X 550 mm rim and pneumatic braking system are also available. This intelligent option allows increasing the level of safety during road transport.

It never stops

With the 2018 update, the rear wheel support has been reinforced, leaving more space between it and the wheel. This way it is possible to plough without limits, even in non-ideal conditions, avoiding any kind of clogging.
